I recently completed my Master's degree in Data Science at Uppsala University and am interested in pursuing a career that combines machine learning, software development, and research. The Research Engineer position at KTH is particularly appealing because it offers the opportunity to contribute to ongoing research projects while continuing to develop both technical and academic skills.

My background is primarily in machine learning, data analysis, and software development. During my studies and professional experience, I have worked extensively with Python, data processing, machine learning workflows, and experimentation. My master's thesis focuses on multimodal machine learning, requiring the design and evaluation of custom deep learning architectures, management of large datasets, and systematic benchmarking of different modelling approaches.

Alongside my general interest in machine learning, a significant portion of my recent work has focused on healthcare applications. Through a health innovation course, I studied the European health technology landscape and the challenges involved in bringing new technologies into clinical practice. I also investigated healthcare data interoperability challenges in Sweden and recently began a pilot collaboration with the Haematology and Oncology Department at King Faisal Specialist Hospital in Saudi Arabia exploring AI-assisted interpretation of electrophoresis results. These experiences strengthened my interest in applying machine learning to complex real-world problems while exposing me to research questions at the intersection of data, technology, and healthcare.

Alongside my academic work, I have experience working with real-world data and stakeholders. At Samsung Electronics, I worked with data quality, automation, forecasting, and process improvement, where much of the work involved handling large datasets, identifying issues, and developing practical solutions. These experiences strengthened my ability to work independently while also collaborating with colleagues from different backgrounds.

What attracts me most to this position is the opportunity to contribute to active research projects in a practical capacity. I enjoy the process of exploring datasets, conducting experiments, evaluating results, and building reliable tools that support research objectives. I am also interested in gaining experience in teaching and supporting students as a teaching assistant.

I believe my background in machine learning, programming, and data-driven problem solving would allow me to contribute effectively to the ongoing work at KTH, while providing an excellent environment for me to continue developing as a researcher and engineer.
